

# INTRODUCING purrr

*The purrr package provides an alternative means to iterate over elements and perform a set function*

*Each map function works the same `map_*(x, f)`:*

- 1. loop over x*
- 2. apply function f to each element*
- 3. return the results*

*This is an alternative approach to the apply family of functions*

# BASICS OF THE MAP FUNCTIONS

```
map_*(vector, function)
```
