FUNCTION OUTPUT

```
pv <- function(FV, r, n) {</pre>
  present_value <- FV / (1 + r)^n</pre>
  round(present_value, 2)
pv(FV = 1000, r = .08, n = 5)
[1] 680.58
pv2 <- function(FV, r, n) {</pre>
  present_value <- FV / (1 + r)^n</pre>
  return(present_value)
  round(present_value, 2)
pv2(1000, .08, 5)
[1] 680.5832
```

What gets returned from a function is either:

- 1. The last expression evaluated
- 2. return(value), which forces the function to stop execution and return value

FUNCTION OUTPUT

```
pv <- function(FV, r, n) {</pre>
  present_value <- FV / (1 + r)^n</pre>
  round(present_value, 2)
pv(FV = 1000, r = .08, n = 5)
[1] 680.58
pv2 <- function(FV, r, n) {</pre>
  present_value <- FV / (1 + r)^n</pre>
  return(present_value)
  round(present_value, 2)
pv2(1000, .08, 5)
[1] 680.5832
```

What gets returned from a function is either:

- 1. The last expression evaluated
- 2.return(value), which forces
 the function to stop
 execution and return value

Note the differences in how we call these functions. Why do both cases work?
