## YOURTURN!

Going back to the rescale function add conditional statements to check and provide appropriate errors or messages for:

- making sure x input is a numeric vector
- · digits input is a numeric vector of one element
- na.rm input is a single logical input

## SOLUTION

```
rescale <- function(x, digits = 2, na.rm = TRUE){
 # ensure argument inputs are valid
  if(!is.numeric(x)) {
    stop('x must be an atomic numeric vector')
  if(!is.numeric(digits) | length(digits) > 1) {
    stop('digits must be a numeric vector of one element')
  if(!is.logical(na.rm)) {
    stop('na.rm must be logical input (TRUE or FALSE)')
  if(isTRUE(na.rm)) x <- x[!is.na(x)]</pre>
  rng <- range(x)</pre>
  scaled <- (x - rng[1]) / (rng[2] - rng[1])
  round(scaled, digits = digits)
```

```
rescale <- function(x, digits = 2, na.rm = TRUE){
  # ensure argument inputs are valid
  if(!is.numeric(x)) {
    stop('x must be an atomic numeric vector')
  if(!is.numeric(digits) | length(digits) > 1) {
    stop('digits must be a numeric vector of one
element')
  if(!is.logical(na.rm)) {
    stop('na.rm must be logical input (TRUE or
FALSE)')
```
