INTRODUCING `purrr`

The `purrr` *package provides an alternative means to iterate over elements and perform a set function*

Each map function works the same `map_*(x, f)`:

1. *loop over* x
2. *apply function* f *to each element*
3. *return the results*

This is an alternative approach to the apply family of functions

BASICS OF THE MAP FUNCTIONS

```
map_*(vector, function)
```

f(x)
